Android Library Release Notes

Version 6.0.0 of the Comscore library introduces public API changes. Upgrading existing implementations of older library versions will require a small amount of code changes, which are explained in an appendix of the implementation guides.

Library Version 6.1.0.191217

Release Date: December 18, 2019
Data Collection Model Version: 6.1
Supported OS Versions: 4.1 - 9.0 (Android API levels 16 - 28)

Feature changes:

1. (TAG-5676, TAG-5705) Add Network Affiliate as `StreamingAnalytics` content asset metadata.
    Description: Network Affiliate was identified as standard content metadata
    Resolution: Add an API method for Publishers to specify the Network Affiliate value.

2. (TAG-5728, TAG-5731, TAG-5732, TAG-5740) Remove code of previously deprecated public API elements (which have already been removed or hidden or otherwise should not longer be available).
    Description: Some of the configuration settings were deprecated and/or removed from the public API with the introduction of data model 6.0, while source code for the involved functionality was retained.
    Resolution: Ensure the configuration settings are no longer present and any source code that is no longer needed is removed.

3. (TAG-5729) Collect marker for Live+DVR stream.
    Description: For validation and troubleshooting purposes it needs to be clear from the collected data when an asset is identified to be a Live+DVR stream.
    Resolution: Add a marker label which indicates whether or not an asset is a Live+DVR stream.

4. (TAG-5893) Include additional metadata labels when distinguishing different assets.
    Description: Taking from data collection model 5.0 some asset metadata labels are used to detect asset changes. Over time other labels have been added which can be used in stead to identify different assets. These labels are not inspected during asset change detection.
    Resolution: Update asset change detection to include key asset metadata labels which were added after data collection model 5.0.

Bug fixes:

1. (TAG-5772, TAG-5773) Ensure Project ID setter method is available on `StreamingAnalytics` objects.
    Description: The method to specify Project ID values was not exposed on the `StreamingAnalytics` public API.
    Resolution: Add the method to specify Project ID values to the `StreamingAnalytics` public API.

2. (TAG-5878) Prevent a race condition which could cause crashes when application life cycle notification methods are called from different threads.
    Description: Calling application life cycle notification methods from different threads sporadically leads to a race condition which causes a crash.
    Resolution: Prevent the race condition from occurring when application life cycle notification methods are called from different threads.

3. (TAG-5902) Ensure break number is incremented when multiple consecutive mid-roll advertisement breaks occur for the same content asset.

Description: The break number is kept at value 1 when multiple consecutive mid-roll advertisement breaks occur for the same content asset, rather than being incremented with each mid-roll advertisement break.

Resolution: Ensure break number is automatically incremented when when multiple consecutive mid-roll advertisement breaks occur for the same content asset.

4. (TAG-5936) Ensure last known content position on advertisements is collected with the correct value.

    Description: The last known content position was stored in way that it reflected the position of the content of the previous occurrence of halted playback.

    Resolution: Ensure the last known content position is updated correctly for the following advertisement to collect the appropriate value.

Known issues and limitations:

▪ There were no known issues for this release.

Library Version 6.0.0.191011

Release Date: October 14, 2019

Data Collection Model Version: 6.0

Supported OS Versions: 4.1 - 9.0 (Android API levels 16 - 28)

Feature changes:

1. (TAG-3628) Simplify and future-proof Streaming Tag implementation design and improve consistency of API naming and design of all library elements.

    Description: Aside from applying internal redesign to remove the root causes of some difficult to reproduce bugs, the overall design of the solution is a few years old and can use an overhaul to apply new insights. Feature changes include:

    ▪ Integrate the `ReducedRequirementsStreamingAnalytics` solution into the 'standard' `StreamingAnalytics` solution to have a single Streaming Tag implementation.

    ▪ Provide Streaming Tag metadata objects with setters to allow developers to provide metadata without knowledge of label names. *Support for the use of hashmaps with labels from existing implementations is available (see appendix with update instructions in the implementation instructions).*

    ▪ Remove API elements which are no longer needed.

    Resolution: Apply the changes and increment the major version number accordingly.

2. (TAGLANDR-187, TAG-3995, TAG-4173) Compile the library with the *Position Independent Executable* (PIE) flag and drop support for Android versions below 4.1 (API level 16).

    Description: Android 4.1 introduced the *Position Independent Executable* (PIE) flag. To prevent abuse of an Android vulnerability the library needs to support this flag. This requires the minimum-supported Android version to be increased to 4.1 (instead of 2.3 which was applicable for previous library versions). This change includes removing any workarounds that applied to Android OS versions below 4.1.

    Resolution: Remove workarounds to have backwards compatibility with older Android versions and implement a safeguard mechanism to ensure the library fails silently when running on Android versions below 4.1. This major version of the library the minimum-supported Android version is 4.1 and deliverables are compiled with the PIE flag.

3. (TAG-5090) Add Distributed Content Tagging functionality.

    Description: Provide a simple solution for tagging distributed content in applications.

    Resolution: Add the `notifyDistributedContentViewEvent` API method.

4. (TAG-5131) Make all transmission secure (HTTPS) by default.

    Description: Transmission was non-secure by default which does align with contemporary practices.

    Resolution: Let transmission be secure by default.

5. (TAGLANDR-188, TAG-4169) Drop support for *mips* and *mips64* architectures.

Description: The *mips* and *mips64* architectures are no longer supported by the Android NDK which is used by the library.

Resolution: Remove support for *mips* and *mips64* architectures.

Bug fixes:

1. (TAG-4965) Prevent crashes when `StreamingAnalytics` or `ReducedRequirementsStreamingAnalytics` API methods are called to notify of streaming events while the `Analytics` instance is already de-allocated.

    Problem: When an application starts its termination routine it calls the destructor of all static instances. The library internally uses a static instance which could end up being referenced from other threads while it is being destroyed, causing a crash. While this issue was fixed in a previous library version not all use cases could be resolved.

    Resolution: Apply internal design changes to resolve this for all use cases.

2. (TAG-5738) Correct per asset playback counter unique and largest-consecutive playback metrics collection.

    Problem: The data for unique and largest-consecutive playback of the current asset playback counter is reset when an asset transitions into IDLE state. This means merging of intervals upon resuming playback — i.e., the playback counter is not incremented — occurs against an empty history.

    Resolution: Ensure the data for unique playback and largest-consecutive playback per asset playback counter is reset only when the asset playback counter is incremented.

3. (TAG-5739) Improve elapsed time metrics collection.

    Problem: There are use cases where elapsed time does not include time-spent outside of playback.

    Resolution: Ensure the data for elapsed time is collected as soon as state changes from *idle*.

Known issues and limitations:

▪ There were no known issues for this release.
