

Android Library Release Notes

Version 6.0.0 of the Comscore Library introduces public API changes. Upgrading existing implementations of older library versions will require a small amount of code changes, which are explained in an appendix of the implementation guides.

Library Version 6.16.0

Release Date: October 7, 2026

Data Collection Model Version: 6.9

Supported OS Versions: 5.0 - 17.x (Android API levels 21 - 37)

Feature changes:

- (TAG-8087) Replace the deprecated `android.preference.PreferenceManager` with AndroidX Preference Library.
Description: In API level 29 `android.preference.PreferenceManager` was deprecated. Our library uses `PreferenceManager` only for reading user consent values from a CMP.
Resolution: Add AndroidX Preference Library as a dependency and replace the use of the deprecated `PreferenceManager` with Preference Library. This means this update is not a drop-in replacement for those who manually include the Comscore Library in their application project.
- (TAG-9727) Update build toolchain to API 37.
Description: We can update the build toolchain to the most recent API Level (37).
Resolution: Update the build toolchain to API Level 37, using NDK r28, JDK 17 (bytecode will still be Java 11), AGP 9 and Gradle 9.
- (TAG-9762) Build Android Library binaries with extra hardening flags.
Description: A publisher's risk assessment security scan indicated the library is not compiled with libc function fortification or stack-smashing protection and has requested these hardening options be enabled.
Resolution: The corresponding compiler flags to enable these hardening options have been added after determining they have no detrimental effect on library performance.

Bug fixes:

- (TAG-9701) Remove unit test classes from library AAR file.
Description: Our library's ProGuard configuration caused us to inadvertently ship unit test classes in the library AAR file. While this doesn't affect consumers of the library it does violate release standards because test code should not be shipped.
Resolution: Modify the project configuration to ensure test packages are not included in the library AAR file.

Known issues and limitations:

- There were no known issues for this release.

Library Version 6.15.0

Release Date: July 8, 2026

Data Collection Model Version: 6.9

Supported OS Versions: 5.0 - 16.x (Android API levels 21 - 36)

Feature changes:

1. (TAG-9568) Integrate surgical ProGuard keep rules into the comscore.aar file.

Description: The implementation instructions include a directive for using ProGuard with broad consumer keep rules. According to Google this can have severe impact on R8's capabilities to optimize apps.

Resolution: To unblock additional R8 app optimizations the comscore.aar file includes surgical keep rules in its own ProGuard configuration. As a result of this it will no longer be necessary to provide keep rules for the Comscore Library in the application project's ProGuard configuration.

Bug fixes:

1. (TAG-9545) Prevent application deadlocks caused by a listener pattern.

Description: A listener pattern has a concurrency issue that can cause application deadlocks.

Resolution: Create a dedicated thread-safe class that eliminates the concurrency issue.

Known issues and limitations:

- There were no known issues for this release.

Library Version 6.14.0

Release Date: January 29, 2026

Data Collection Model Version: 6.9

Supported OS Versions: 5.0 - 16.x (Android API levels 21 - 36)

Feature changes:

1. (TAG-9509) Add an API method to identify streaming media consumption of child-directed content.

Description: Some content assets in the Playback Session could be child-directed even though the app itself is not child-directed. While there is a mechanism to indicate the app itself is child-directed, there is no mechanism to indicate just a particular streaming media asset as child-directed.

Resolution: Add API method [setChildDirectedPlaybackSessionEnabled](#) on [StreamingAnalytics](#). This method can be used to indicate whether or not a Playback Session has child-directed assets.

Bug fixes:

1. (TAG-9488) Prevent application crashes caused by an unnecessary framework registration during SDK initialization.

Description: Shared C++ code contains a framework that was being registered automatically during SDK initialization which could lead to crashes.

Resolution: Prevent unnecessary lifecycle callbacks that caused the framework to register automatically.

Known issues and limitations:

- There were no known issues for this release.

Library Version 6.13.0

Release Date: September 16, 2025

Data Collection Model Version: 6.8

Supported OS Versions: 5.0 - 16.x (Android API levels 21 - 36)

Feature changes:

1. (TAG-8749) The format of the server response for [getActivationCategories](#) has been changed.
Description: The format has been changed to just JSON.
Resolution: Account for the new format and ensure the API method continues to return the expected response when used.
2. (TAG-9382) Reinstate support for apps running on devices with Android 5.0-Android 7.0.
Description: In Android Library version 6.12.0 the [minSdkVersion](#) of the library was increased to API level 24 (Android 7.0) which was unnecessary and due to a misinterpretation of Google's documentation.
Resolution: Return the [minSdkVersion](#) of the library to API level 21 (Android 5.0).
3. (TAG-9415) Improve the format of the log output.
Description: Currently log output could be more than 1 line due to LogCat limitation. It's not clear from the current format how many lines are to be expected.
Resolution: Change the format to include how many lines are expected at the beginning of each log line.

Bug fixes:

1. (TAG-9329) Resolve potential cause of Application Not Responding crashes.
Description: TAG-9147 changes relating to management of listeners for version 6.12.1 may have had the side effect of retaining locks while listeners are being deregistered.
Resolution: Ensure locks are not unnecessarily retained while listeners are deregistered.

Known issues and limitations:

- There were no known issues for this release.

Releases from 2024 and earlier have been removed from the release notes.
